

New! For Your Time Machine Wireless Gun-Start System

Wireless Receiver - Range Extender Boom

The Range Extender Boom is used to increase the range of your Wireless Gun-Start system by elevating the Wireless Receiver unit.

This may be necessary in order to achieve a strong signal connection between the Gun Transducer and the Receiver unit when they are diagonally located across the track on fields that have a significant amount of terrain “crown” in the middle of the field.

The terrain crown on football fields can block a significant amount of the transmitted signal and thereby reduce the range of the wireless system when the receiver and transmitter are on diagonally opposed corners of the field. In order to compensate for this, the Receiver unit must be elevated a few feet – typically around 5 ft off the ground is adequate. Therefore we offer a tri-pod boom with an attached 6 ft cable in order to achieve this.

Wireless System Receiver – Range Extender Boom with 6’ cable \$125
